"EDUHIVE"

MINI PROJECT

for the Degree of

Bachelor of Technology

In

Computer Science & Engineering

By

NAGESH SHIRISH MANSUKE

Under the Valuable Guidance of

Mrs. Smitha Rathod

Pursued in

DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

SHRI GURU GOBIND SINGHJI INSTITUTE OF ENGINEERING AND TECHNOLOGY, VISHNUPURI, NANDED - 431606 (M.S.).

2025 - 2026

SHRI GURU GOBIND SINGHJI INSTITUTE OF ENGINEERING AND TECHNOLOGY, VISHNUPURI, NANDED 431606, Maharashtra, India.

Department of Computer Science & Engineering

CERTIFICATE

This is to certify that the project "Eduhive" (Building Risk Assessment) being submitted by Nagesh Shirish Mansuke to Shri Guru Gobind Singhji Institute of Engineering and Technology for the Mini Project is records of Bonafide work carried out by him under the guidance of Mrs. Smita Rathod. The matter contained in this dissertation has not been submitted to any other University or institute for any project.

_____	_____
Mrs. Smitha Rathod	Prof. A.M.Bainwad
Project Guide	Head of the Department (CSE)

Date : ……

Place : SGGSIE&T, Nanded.

DECLARATION

I hereby declare that the project report entitled "Eduhive," submitted in partial fulfilment of the requirements for the course Mini Project in the third year of Bachelor of Technology in Computer Science & Engineering, is a record of original work carried out by me. The work has been performed under the supervision and guidance of Mrs. Smitha Rathod. I further declare that this project has not previously formed the basis for the award of any other thing in this or any other Institution. In compliance with ethical standards for reporting scientific information, all sources, software tools, and literature used in this project have been duly acknowledged and cited.

Nagesh Shirish Mansuke

(2022BCS062)

ACKNOWLEDGEMENT

I feel truly grateful to have had the opportunity to work under the guidance of Mrs. Smita Rathod, who supported me throughout this project with valuable insights, constant encouragement, and patience. Their guidance made a significant difference in shaping the direction and outcome of my work. I would also like to sincerely thank Dr. M. B. Kokare (Director SGGSE&T, Nanded) and Prof. A. M. Bainwad (Head of the Department - Computer Science and Engineering), for their continued support and encouragement during the course of this project. Finally, I would like to express my heartfelt gratitude to my parents for their unwavering support throughout this entire process.

ABSTRACT

EduHive is a smart collaborative study ecosystem designed to improve group learning through real-time interaction, secure communication, and AI-assisted content understanding. The system is developed using the MERN stack, where React.js is used for building an interactive user interface, Node.js and Express.js handle backend services, and MongoDB is used for efficient data storage. Socket.io enables real-time features such as synchronized whiteboards, live polling, and instant messaging, allowing more than 50 users to collaborate simultaneously with reliable and fault-tolerant event handling.

To enhance learning efficiency, EduHive integrates an AI-driven conceptual summarizer using natural language processing models through the OpenAI API. This feature processes study materials and generates concise, topic-wise summaries, reducing revision time and improving conceptual clarity. Security and data privacy are ensured through JWT-based authentication, encrypted password storage using Bcrypt, and role-based access control to manage user permissions. EduHive provides a scalable, secure, and intelligent solution for modern collaborative learning environments.

CHAPTER 1

INTRODUCTION

1.1 Background

In recent years, the field of education has undergone a significant transformation due to the rapid advancement of digital technologies. Traditional classroom-based learning methods are increasingly being supplemented or replaced by online platforms that offer flexibility, accessibility, and scalability. Learning Management Systems (LMS) such as Moodle and Google Classroom have enabled institutions to deliver educational content efficiently. However, these systems often lack real-time collaboration and intelligent assistance, which are essential for enhancing student engagement and conceptual understanding.

Modern learners require more interactive and dynamic learning environments where they can actively participate, collaborate with peers, and receive immediate feedback. The rise of realtime communication technologies and Artificial Intelligence (AI) has opened new possibilities for creating such environments. Real-time collaboration tools like chat systems, shared whiteboards, and live polling mechanisms allow students to engage in group discussions and problem-solving activities. At the same time, AI technologies enable intelligent content analysis, summarization, and personalized learning support.

Despite these advancements, most existing platforms address only specific aspects of the learning process. Traditional LMS platforms focus primarily on content delivery, while AIbased systems emphasize individual learning. There is a lack of unified platforms that combine real-time collaboration with AI-driven learning assistance in a structured academic environment.

To address these limitations, the EduHive system is proposed as a **Smart Collaborative Learning Platform** that integrates real-time interaction, AI-based summarization, and secure multi-user communication. The system is designed to create an engaging and efficient learning ecosystem where students can collaborate, share knowledge, and enhance their understanding through intelligent support.

1.2 Problem Statement

Although various educational platforms are available today, they suffer from several limitations that reduce their effectiveness in modern learning scenarios. Traditional LMS platforms provide basic functionalities such as course management, assignment submission, and discussion forums, but they lack real-time collaborative features. This results in reduced student engagement and limited interaction among learners.

On the other hand, real-time communication tools such as chat applications and video conferencing platforms enable interaction but are not specifically designed for structured academic learning. These systems do not provide features such as content organization, learning analytics, or AI-based assistance.

AI-based educational tools offer personalized learning experiences by providing explanations and answering queries. However, they focus primarily on individual learning and do not support collaborative knowledge building among multiple users.

The major problems identified are:

- Lack of integration between collaboration tools and learning systems
- Absence of AI-based real-time summarization of discussions
- Limited support for multi-user interactive learning
- Poor engagement in traditional LMS platforms
- Lack of centralized platforms combining communication, content, and intelligence

These challenges highlight the need for a unified system that integrates real-time collaboration with AI-powered learning assistance.

1.3 Objectives

The primary objective of the EduHive system is to develop a smart and interactive learning platform that enhances collaboration and learning efficiency. The specific objectives of the project are as follows:

1. To design and develop a real-time collaborative learning system.
2. To integrate AI-based summarization for improving conceptual clarity.
3. To provide interactive tools such as chat, whiteboard, and live polling.
4. To implement secure authentication and role-based access control.
5. To support multiple users participating simultaneously in study sessions.
6. To create a scalable and efficient system architecture.
7. To enhance student engagement through interactive and intelligent features.
8. To provide a centralized platform for communication, learning, and content sharing.

1.4 Purpose of the Project

The purpose of the EduHive project is to create an advanced learning platform that bridges the gap between traditional LMS systems and modern collaborative tools. The system aims to provide an integrated environment where users can interact in real time, share knowledge, and receive AI-driven assistance.

The project focuses on improving the overall learning experience by combining communication, collaboration, and intelligence into a single platform. By enabling real-time interaction and automated summarization, the system reduces the effort required for understanding complex topics and enhances productivity during study sessions.

Furthermore, the platform is designed to be user-friendly and accessible, ensuring that users with minimal technical knowledge can easily interact with the system.

CHAPTER 2

LITERATURE SURVEY

2.1 Collaborative Learning Systems

Collaborative learning is an educational approach in which multiple learners interact and work together to achieve common learning goals. According to Dillenbourg (1999), collaborative learning involves situations where individuals actively participate in knowledge construction through communication and cooperation. This approach has been widely adopted in educational institutions to improve student engagement and critical thinking.

Roschelle and Teasley (1995) emphasized that shared understanding is achieved through coordinated group activity, where learners exchange ideas and solve problems collectively. Similarly, Johnson and Johnson (2014) demonstrated that cooperative learning improves academic performance, retention, and interpersonal skills compared to individual learning methods.

Modern Learning Management Systems (LMS) such as Moodle and Blackboard incorporate collaborative features like discussion forums and group assignments. However, these systems are primarily designed for asynchronous communication and lack real-time interaction capabilities. As a result, they fail to provide a fully interactive and engaging learning experience.

2.2 Real-Time Communication in Education

With the development of web technologies, real-time communication has become an essential component of modern learning systems. Hrastinski (2008) highlighted the importance of synchronous learning, stating that real-time interaction enhances student participation, motivation, and engagement.

Real-time collaboration tools such as Microsoft Teams, Zoom, and Miro provide features like live chat, video conferencing, and shared whiteboards. These platforms enable users to communicate and collaborate instantly, making them useful for group discussions and remote learning.

However, these tools are not specifically designed for structured academic environments. They lack features such as content organization, learning analytics, and integration with educational resources. Additionally, they do not provide intelligent support for analyzing discussions or summarizing learning content.

2.3 Artificial Intelligence in Education

Artificial Intelligence has emerged as a powerful tool in the field of education. AI-based systems can analyze large amounts of data, provide personalized learning experiences, and automate various educational processes.

Woolf (2010) introduced intelligent tutoring systems that adapt learning content based on student performance and behavior. These systems provide customized feedback and improve learning outcomes by identifying knowledge gaps.

Kumar et al. (2020) discussed the role of AI in education, highlighting applications such as automated grading, personalized recommendations, and intelligent content generation. AIbased platforms such as Khan Academy and Coursera use machine learning algorithms to enhance learning experiences.

Recent advancements in Natural Language Processing (NLP) have enabled automatic text summarization, which helps learners quickly understand complex topics. Pérez et al. (2021) demonstrated that AI-based summarization reduces cognitive load and improves comprehension.

Despite these advantages, most AI-based educational systems focus on individual learning and do not support collaborative knowledge building among multiple users.

2.4 Limitations of Existing Systems

Based on the analysis of existing systems, several limitations have been identified:

1. **Lack-of-Integration**
   Most systems focus on either collaboration or AI-based learning but do not integrate both functionalities into a single platform.

2. **Absence-of-Real-Time-AI-Summarization**
   Existing platforms do not provide automatic summarization of discussions and study materials in real time.

3. **Limited-Collaborative-Intelligence**
   AI systems primarily support individual learning and do not facilitate group-based knowledge construction.

4. **Poor-Interactive-Features-in-LMS**
   Traditional LMS platforms lack real-time tools such as whiteboards, live polling, and synchronized interaction.

5. **Fragmented-Learning-Environment**
   Communication tools, learning content, and analytics are often distributed across multiple platforms, making the learning process inefficient.

6. **Lack-of-Academic-Analytics**
   Existing systems do not effectively analyze collaborative discussions to improve conceptual understanding.

7. **Scalability-Issues**
   Many platforms are not designed to handle large numbers of users interacting simultaneously in real-time sessions.

2.5 Research Gap

The literature review clearly indicates that there is a gap in the development of a unified system that combines real-time collaboration, AI-based learning assistance, and structured academic tools.

The key research gaps identified are:

- Need for integration of collaboration and AI in a single platform
- Requirement for real-time summarization of discussions
- Lack of intelligent analysis of collaborative learning sessions
- Need for scalable systems supporting multiple users
- Absence of centralized platforms for communication, learning, and analytics

These gaps highlight the necessity for a system like EduHive, which addresses these challenges by providing an integrated and intelligent collaborative learning environment.

2.6 Contribution of Proposed System (EduHive)

The EduHive system is designed to overcome the limitations of existing systems by integrating real-time collaboration, AI-assisted learning, and secure architecture into a unified platform.

The key contributions of the proposed system include:

- Real-time collaborative learning using chat, whiteboard, and live polling
- AI-based summarization of study materials and discussions
- Intelligent analysis of collaborative content using NLP
- Secure user authentication and role-based access control

- Scalable architecture supporting multiple concurrent users
- Centralized platform combining communication, content, and analytics

By addressing the identified research gaps, EduHive provides a comprehensive solution for modern digital education.

CHAPTER 3

SYSTEM DESIGN

3.1 System Overview

EduHive is a web-based application that enables users to participate in collaborative study sessions. The system integrates multiple functionalities such as real-time chat, collaborative whiteboard, live polling, and AI-based summarization.

The system follows a **layered architecture**, where each layer performs a specific function:

- User Interface Layer
- Application Layer
- Real-Time Communication Layer
- AI Processing Layer
- Database Layer

This layered approach improves scalability, maintainability, and performance.

3.2 System Flow

The system flow describes how data moves through the system during user interaction.

Step-by-Step Flow:

1. The user registers or logs into the system.
2. The system authenticates the user using JWT-based authentication.

3. The user joins or creates a study session.
4. A real-time connection is established using Socket.io.
5. Users interact through chat, whiteboard, and polling features.
6. The data generated during the session is sent to the backend server.
7. The AI module processes the data and generates summaries.
8. The processed information is sent back to users in real time.
9. All session data is stored securely in the database.

This flow ensures seamless interaction and real-time synchronization among users.

3.3 System Architecture

The EduHive system architecture is designed to support real-time collaboration and AI processing. It consists of multiple layers, each responsible for specific tasks.

3.3.1 User Interface Layer

This layer is responsible for user interaction and presentation of information.

Technologies Used:

- React.js
- HTML, CSS, JavaScript **Components:**
- Login and Registration Page
- User Dashboard

- Chat Interface
- Whiteboard Interface
- Polling System
- AI Summary Panel

The UI is designed to be responsive, intuitive, and user-friendly.

3.3.2 Application Layer (Backend)**

This layer handles business logic and request processing.

Technologies Used:

- Node.js
- Express.js **Functions:**
- API handling
- User authentication
- Session management
- Request processing

The backend acts as a bridge between the frontend, database, and AI module.

3.3.3 Real-Time Communication Layer

This layer enables real-time interaction between users.

Technology Used:

- Socket.io **Functions:**
- Real-time chat messaging
- Whiteboard synchronization
- Live polling updates
- Multi-user communication

This layer ensures low-latency communication and synchronization.

3.3.4 AI Processing Layer

This layer provides intelligent learning assistance.

Technology Used:

- OpenAI API (NLP) **Functions:**
- Text summarization
- Chat analysis
- Concept extraction
- Topic-wise explanation

The AI module processes user inputs and generates meaningful insights.

3.3.5 Database Layer This layer

stores all system data.

Technology Used:

- MongoDB

Data Stored:

- User information
- Session data
- Chat message

-
-

3.4 Component Design

The system is divided into multiple modules, each responsible for specific functionality.

3.4.1 User Management Module Handles

user-related operations.

Functions:

- Registration
- Login
- Profile management
- Role-based access control

3.4.2 Real-Time Collaboration Module

Handles interactive features.

Functions:

- Chat system
- Whiteboard
- Live polling
- Multi-user sessions

-
-

3.4.3 AI Assistance Module Provides intelligent learning support.

Functions:

- Summarization
- Chat analysis
- Concept explanation

3.4.4 Content Management Module Manages

study materials.

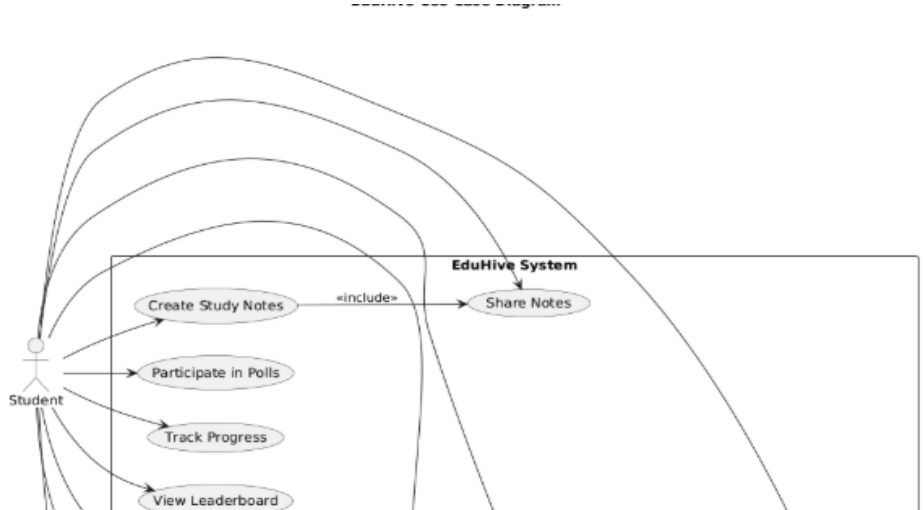

Functions:

- Upload content
- Store data

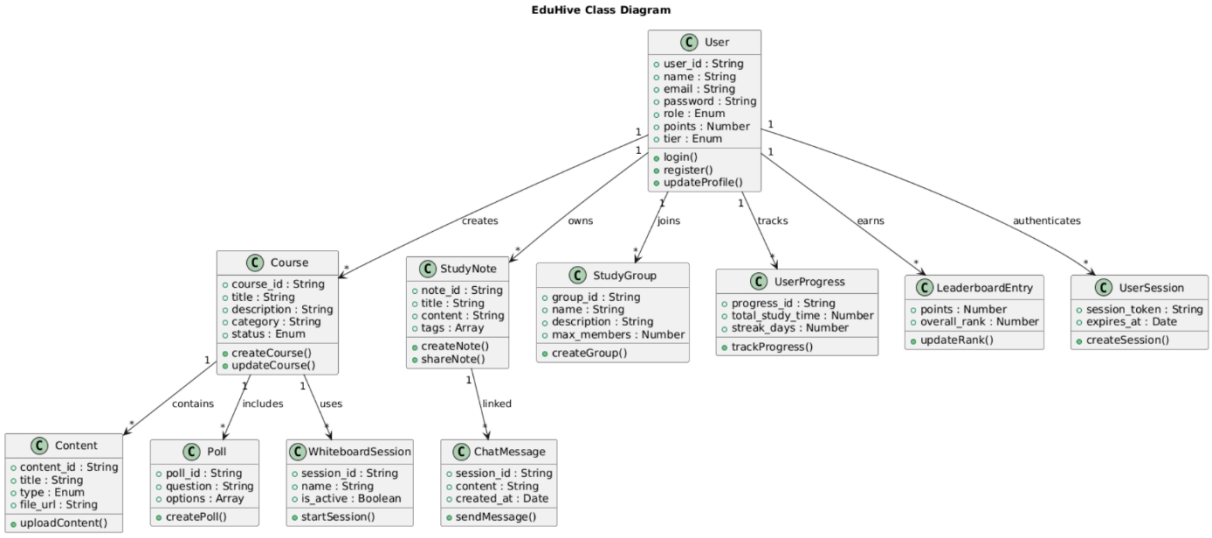

3.5 UML Diagrams

UML diagrams are used to visualize system design and behavior.

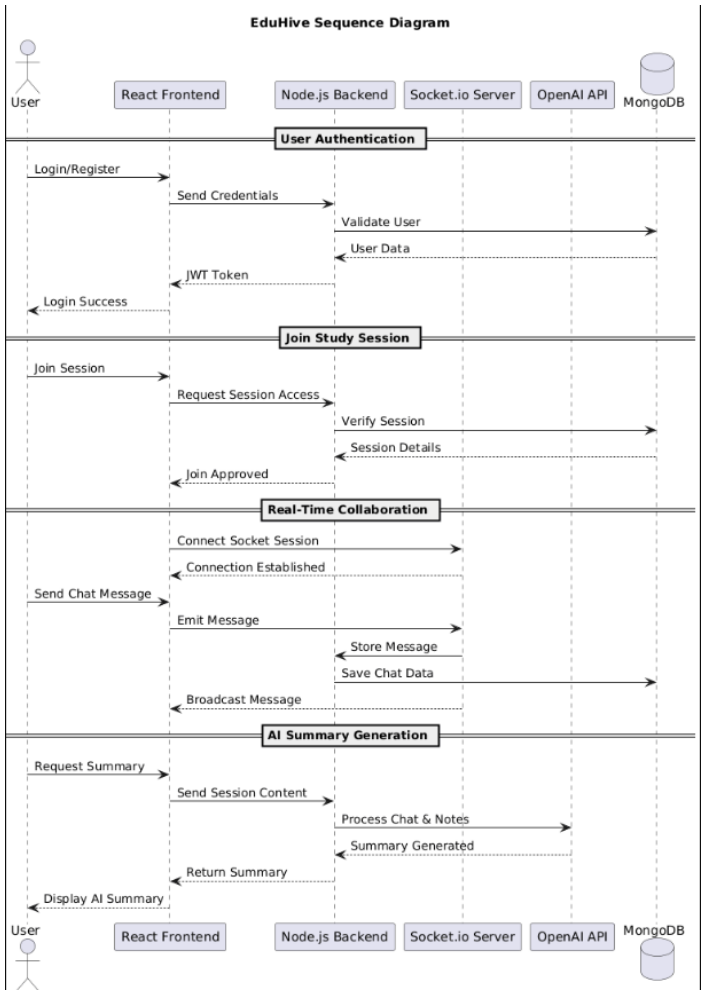

Use Case Diagram

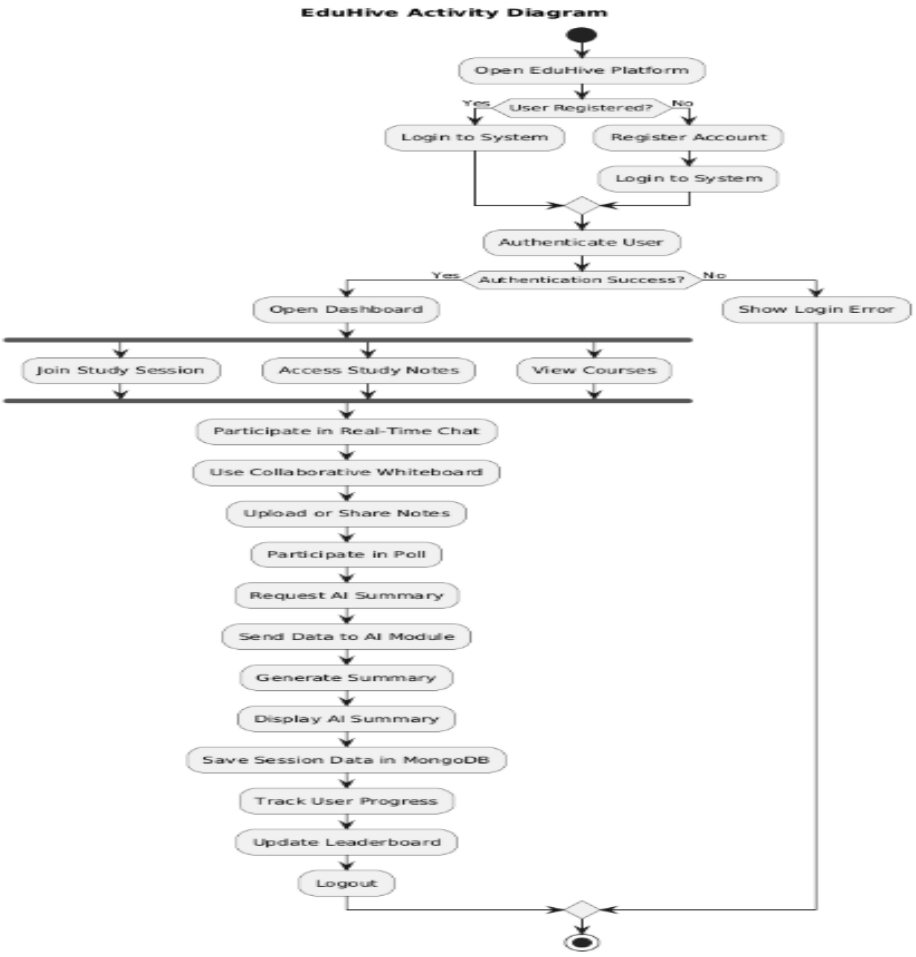

Class Diagram

Sequence Diagram

Activity Diagram: Represents workflow.

CHAPTER 4

IMPLEMENTATION

4.1 Technology Stack

The EduHive system uses modern web technologies to ensure efficient performance and scalability.

Layer	**Technology**
Frontend	React.js, HTML, CSS, JavaScript
Backend	Node.js, Express.js
Database	MongoDB
Real-Time	Socket.io
AI Integration	OpenAI API
Security	JWT, Bcrypt

4.1.1 Frontend (React.js)

React.js is used to build a dynamic and responsive user interface. It enables component-based architecture, making the UI modular and reusable.

Advantages:

- Fast rendering using Virtual DOM
- Reusable components

- Easy state management

4.1.2 Backend (Node.js + Express.js)

Node.js provides a server-side environment for handling asynchronous requests. Express.js simplifies API development and routing.

Functions:

- API creation
- Authentication
- Request handling

4.1.3 Database (MongoDB)

MongoDB is a NoSQL database used for storing structured and unstructured data.

Advantages:

- Flexible schema
- High scalability
- JSON-like document storage

4.1.4 Real-Time Communication (Socket.io)

Socket.io enables real-time, bidirectional communication between client and server.

Features:

- Low latency
- Event-driven architecture
- Multi-user synchronization

4.1.5 AI Integration (OpenAI API)

The AI module uses Natural Language Processing (NLP) to generate summaries and explanations.

Functions:

- Text summarization
- Chat analysis
- Concept explanation

4.2 System Architecture Implementation

The system is implemented in a layered architecture:

1. **Frontend Layer** – Handles UI and user interaction
2. **Backend Layer** – Processes requests and business logic
3. **Real-Time Layer** – Manages communication
4. **AI Layer** – Processes content

5. **Database Layer** – Stores data

Each layer communicates through APIs and sockets.

4.3 Frontend Implementation

The frontend is developed using React.js.

Key Components:

4.3.1 Login & Registration Page

- User authentication interface
- Form validation
- API integration

4.3.2 Dashboard

- Displays available features
- Navigation controls

4.3.3 Chat Interface

- Real-time messaging
- Message display and input

4.3.4 Whiteboard Interface

- Canvas-based drawing
- Real-time synchronization

4.3.5 AI Summary Panel

- Displays AI-generated summaries
- Updates dynamically

4.4 Integration of Modules

All modules are integrated to form a complete system.

Integration Flow:

Frontend	→	Backend	→	Database
Frontend	↔	Socket.io	↔	Backend
Backend	→	AI	→	Frontend

This ensures smooth communication between components.

4.5 Error Handling & Validation

The system handles errors efficiently.

Types:

- Input validation errors
- Authentication errors
- Server errors **Techniques:**
- Try-catch blocks
- Middleware validation

4.6 Performance Optimization

The system is optimized for performance.

Techniques:

- Efficient API calls
- Data caching
- Asynchronous processing
- Optimized database queries

CHAPTER 5

RESULTS AND EVALUATION

5.1 System Testing Overview

The EduHive system was tested under different conditions to verify its functionality and performance. The testing process included:

- Functional testing
- Real-time communication testing
- AI output evaluation
- User interface testing
- Performance testing

Each module was tested individually and then integrated to ensure smooth operation of the entire system.

5.2 Functional Testing

Functional testing ensures that all features of the system work as expected.

Test Cases:

Test Case	**Expected Result**	**Status**
User Registration	User successfully registered	Passed
User Login	Secure login with JWT token	Passed

Join Session	User joins session successfully	Passed
Real-Time Chat	Messages delivered instantly	Passed
Whiteboard	Drawing synchronized across users	Passed
Live Poll	Poll updates in real-time	Passed
AI Summary	Summary generated correctly	Passed

The results indicate that all functionalities are working correctly without errors.

5.3 Real-Time Performance Evaluation

The real-time features of the system were evaluated using multiple users interacting simultaneously.

Observations:

- Chat messages are delivered with minimal delay (<1 second)
- Whiteboard updates are synchronized across users
- Live polling responses are updated instantly
- No data loss observed during communication **Conclusion:**

The system provides efficient real-time communication using Socket.io and performs well under multi-user conditions.

5.4 AI Output Evaluation

The AI module was tested for summarization and content analysis.

Input:

- Chat discussions
- Study materials **Output:**
- Concise summaries
- Key concept extraction

Evaluation Criteria:

Parameter	**Observation**
Accuracy	High
Relevance	Relevant to topic
Clarity	Easy to understand

The AI-generated summaries help users quickly understand complex topics and reduce learning time.

5.5 User Interface Evaluation

The usability of the system was evaluated based on user interaction.

Observations:

- Interface is simple and easy to navigate
- All features are accessible from dashboard
- Minimal learning curve for new users
- Responsive design across devices **Feedback:**

Users found the system intuitive and user-friendly.

5.6 Comparison with Existing Systems

The EduHive system was compared with existing platforms.

Feature	**LMS**	**Collaboration Tools**	**AI Systems**	**EduHive**
Real-Time Interaction	No	Yes	No	Yes
AI Summarization	No	No	Yes	Yes
Collaboration	Limited	Yes	No	Yes
Unified Platform	No	No	No	Yes

EduHive provides a more comprehensive solution compared to existing systems.

5.7 Advantages of the System

- Real-time collaborative learning

- AI-based summarization
- Secure authentication
- Scalable architecture
- User-friendly interface

5.8 Limitations of the System

- Depends on internet connectivity
- AI responses depend on input quality
- Limited to web-based platform
- No video conferencing feature

CHAPTER 6

CONCLUSION AND FUTURE SCOPE

6.1 Conclusion

The EduHive system was developed as a **smart collaborative learning platform** that integrates real-time communication with Artificial Intelligence to enhance the learning experience. The primary objective of this project was to overcome the limitations of traditional Learning Management Systems (LMS) and existing collaboration tools by providing a unified environment for interactive and intelligent learning.

The system successfully implements key features such as real-time chat, collaborative whiteboard, live polling, and AI-based summarization. These features enable users to actively participate in study sessions, share knowledge, and improve their understanding of concepts through group interaction. The integration of AI allows automatic summarization of discussions and study materials, which reduces effort and enhances learning efficiency.

The system architecture, based on the MERN stack and Socket.io, ensures scalability, performance, and real-time synchronization. The use of JWT-based authentication and encryption techniques provides a secure environment for users. The modular design of the system allows easy maintenance and future enhancements.

The results obtained from system testing and evaluation demonstrate that EduHive performs efficiently under multi-user conditions, maintains data consistency, and provides accurate AIgenerated outputs. The system meets all the functional and non-functional requirements defined during the requirement analysis phase.

Overall, EduHive provides an effective solution for modern digital education by combining collaboration, communication, and intelligence into a single platform. It enhances student engagement, improves conceptual understanding, and supports collaborative knowledge building.

6.2 Future Scope

Although the EduHive system provides a comprehensive solution for collaborative learning, there are several areas where the system can be further improved and extended in the future.

6.2.1 Video Conferencing Integration

The system can be enhanced by adding video conferencing features to enable face-to-face interaction between users. This will improve communication and provide a more immersive learning experience.

6.2.2 Mobile Application Development

Currently, the system is web-based. Developing a mobile application for Android and iOS platforms will increase accessibility and allow users to participate in study sessions anytime and anywhere.

6.2.3 Advanced AI Capabilities

The AI module can be improved by incorporating advanced machine learning models for better summarization, personalized learning recommendations, and predictive analysis of user performance.

6.2.4 Learning Analytics Dashboard

A detailed analytics dashboard can be added to track user participation, performance, and learning progress. This will help users and educators make data-driven decisions.

6.2.5 Integration with Educational Platforms

The system can be integrated with existing LMS platforms such as Moodle or Google Classroom to enhance its usability and adoption in educational institutions.

6.2.6 Offline Mode Support

Future versions of the system can include offline capabilities, allowing users to access study materials and sync data when internet connectivity is available.

6.2.7 Enhanced Security Features

Additional security mechanisms such as multi-factor authentication and data encryption can be implemented to further improve system security.

6.3 Final Remarks

The EduHive system represents a step towards the future of digital education by combining real-time collaboration with AI-driven learning assistance. With further enhancements and improvements, it has the potential to become a powerful platform for modern educational environments.
